

AI Facilitator Assistant

Helping you support every participant on the Hope Programme —
spot who needs you, and reply with warmth, faster.

People living with IIH 2025 · Participant-support dashboard

Why we built this

- People living with long-term conditions can **quietly disengage** between sessions — and then drop out.
- No facilitator can watch **everyone, every week**.
- A short, warm, **well-timed** message early often makes the difference between someone staying or leaving.

The assistant helps you see who needs you this week — and reply sooner, in your voice.

What it does

1 · SPOT

Who needs attention

Every participant, ranked each week — and the plain-language reasons why.

2 · SUPPORT

A warm draft reply

A ready-to-send message in the programme's voice — you review, edit, and send.

It surfaces and suggests. You decide and send.

How it fits together

Everything runs on secure, private systems · personal details are removed · nothing is sent without you.

How it fits together — the full picture

The detailed view (for reference): the platform · the dashboard · the two AI services — with where data is kept and how it's secured.

The dashboard at a glance

Three panels — **who needs attention** (left) · **why** (middle) · **a ready-to-send reply** (right).

Each week: who needs attention — and why

- **The queue** ranks everyone by who needs attention — *Needs attention · Check in soon · On track*. The people most likely to slip sit at the top.
- **The why is clear**: a risk level, the main reasons (e.g. few visits, not posting, no contact yet), and a recommended approach + wellbeing cue for how to reach out.
- **A weekly rhythm**: the scores refresh each week — start at the top of the queue.

Week 1 matters most: a warm first contact early measurably lowers the chance someone drops out.

Drafting the reply

- **Two or three warm tones** to choose from — pick what fits.
- **Edit, polish, and send** — always your words, your call.
- Someone **hasn't posted yet**? A "first check-in" gives you a warm opener so you can still reach out.

The draft is a starting point — never sent on its own.

What's behind it

- The **draft replies** come from a small, fine-tuned **AI language model**, trained on real (*anonymised*) Hope facilitator replies — so it sounds like the programme, not a generic chatbot.
- The **risk score** comes from a **Random Forest** model — a well-established machine-learning method. It treats early drop-out as a **classification problem**: from each participant's weekly activity, how likely are they to disengage? Validated on past cohorts (about **0.94** accuracy).
- Both produce **suggestions only** — your judgement always leads.
